TEXT: The author discusses the problem of motion of artificial earth satellites at great heights; the problem is equivalent to the classical one regarding the motion of a material point under the effect of a central force. The concepts of the first and second cosmic velocities and their numerical values for the earth and other planets of the solar system are discussed. Formulas are adduced for computing the velocity  $v$  of a sputnik and the period of its rotation as a function of its height. L. S. Yevdokimova.

AUTHOR: Kosmodem'yanskiy, A. A.

TITLE: Variational problems in dynamics of orbital aircraft ✓

SOURCE: Moscow, Universitet. Vestnik. Ser. 1. Matematika, mehanika, no. 4,  
1963, 70-76

TOPIC TAGS: orbital flight, orbital aircraft, variational problem, reciprocal  
isoperimetric problem

ABSTRACT: The optimal conditions of motion of an orbital aircraft with a  
liquid-propellant reactor power plant are studied under the assumptions that  
1) velocities are cosmic ( $M > 10$ ), 2) altitude is on the order of 60 to 100  
km, and 3) the effect of aerodynamic forces is substantial. The mass variation  
law for an orbital aircraft is established, and equations of extremals are de-  
rived for those flight conditions which would provide for maximum range and  
maximum flight time with a given propellant reserve. Two reciprocal isoperi-  
metric problems are studied, and extremals for range and flight time are found.  
A calculation sequence is presented for the simplest flight regime, in which  
 $T = T_{\max}$  and  $v$ , tends to infinity (case of the flat earth). The expression

 Kosmodem'anskii, A. A. *Lectures on the mechanics of bodies of variable mass*. Moskov. Gos. Univ. Uchenye Zapiski 154, Mekhanika 4, 73-180 (1951). (Russian)

These lectures are from a course which the author has given since the session 1943/44 at the Soviet academy of military and aeronautical engineering. The paper begins with a historical account of theoretical mechanics giving especial emphasis to the work of Meßerskii (1859-1935) and Tsiolkovskii (1857-1935) who evidently were the first to consider mathematically problems concerning bodies of variable mass. The work of Esnault-Pelterie, Goddard, Oberth, Levi-Civita, Tsander and Kondratjuk is mentioned, but there is no reference to more recent work done outside Russia.

First lecture. Here are derived the equations of motion of a particle (the author uses the word 'point' for the word 'particle' which he uses in a different connexion) of variable mass, including the equation

$$(1) \quad M \frac{dv}{dt} = \mathbf{F} + \mathbf{V}_r \frac{dM}{dt},$$

where  $M$  is the mass of the particle,  $v$  its velocity,  $t$  the time,  $\mathbf{F}$  the external force acting and  $\mathbf{V}_r$  the relative velocity of the ejected part. In the case when the absolute velocity of the ejected part is zero this equation was first obtained by Meßerskii [Thesis, St. Petersburg, 1897]. Equation (1) is resolved into three scalar equations for the case when  $\mathbf{F}$  is composed of gravity and air resistance in the direction opposing motion. When these forces are neglected, the now well-known law  $v = v_0 + V_r \log(M_0/M)$  is deduced from (1).

*Kazan'da 1904'ye ait 2/3*  
 motion of a particle which is both losing mass and gaining mass is obtained; it is of similar form and was given by Meščerskiĭ [Izvestiya St.-Peterburg. Politehn. Inst. 1, no. 1-2, 77-118 (1904)]. In §2 this is applied, as an approximation, to the motion of a reaction boat which expels the same amount of water as it takes in. The motion of a uniform chain falling over the edge of a table is studied as a further example on variable mass in §3.

*Fifth lecture.* In §1 the rectilinear motion of an aircraft with air-jet motor is considered; it is assumed that conditions are such that the particle theory can be applied. Thus, for example, the motion of the mass-centre in the aircraft is supposed negligible, and the motion of the air inside the aircraft is ignored. Resistance is taken to be proportional to velocity. The velocity and horizontal range are calculated. In §2 rectilinear motion of a particle under gravity is treated for a general law of air resistance, it being assumed that the rate of gaining mass is a constant multiple of the rate of losing mass. The optimum form of the function  $f(t)$  is found in order to give the maximum range. In §3 the similar problem of finding the optimum  $f(t)$  such that a given distance is traversed in a minimum time is discussed. In both cases  $f(t)$  is obtained, in the first place, as a function of the velocity.

*Sixth lecture.* This deals with the converse problem where from known external forces and motion the law of burning is to be determined. In §1 such a problem due to Meščerskiĭ (1897) is considered; it is assumed that  $s$  and  $v$  are known as functions of  $t$ , also  $g=g(s)$  and the inclination  $\theta$  of the trajectory (assumed constant). With these conditions  $f(t)$

and attributed to Tsiolkovskii (1903). The 'burning laws' (i)  $f(t)=M/M_0=1-\alpha t$ ; (ii)  $f(t)=e^{-\alpha t}$  are investigated in detail.

*Second lecture.* The vertical movement of a particle of variable mass with the second burning law, under a uniform field of gravity and without air resistance, is considered; the maximum height  $H$  attainable, for given  $a$ ,  $V$ , and final mass  $M_0$ , is obtained. It is deduced that  $H$  is greatest when  $\alpha=0$ , i.e., when the mass is reduced from  $M_0$  to  $M$ , instantaneously. The maximum height attainable at the instant of 'all-burnt' is also obtained. Rectilinear motion without gravity with the first burning law and a resistance proportional to the square of the velocity is also considered.

*Third lecture.* In §1 the motion under a resistance of the form  $a+bv$  is considered for the first burning law. In §2 the author considers a jet aircraft moving horizontally against air resistance so that the lift just compensates the weight. The application of the particle theory to this problem is, of course, only possible as an approximation. The distance traveled during the period when the jet is acting is calculated, for the first burning law, and the optimum value of  $a$  is obtained. In §3 vertical motion under uniform gravity subject to air resistance proportional to the velocity is considered. In §4 the problem is of vertical motion away from the surface of the earth under varying gravity; air resistance is neglected and the maximum velocity attained is sufficiently small so that the distance traveled from the surface is small in comparison with the earth's radius. These assumptions permit simplifying approximations to be used when calculating the distance traveled.

*Fourth lecture.* In §1 the general vectorial equation of

AUTHOR: Kosmodem'yanskiy, A., Professor

TITLE: K. E. Tsiolkovskiy (Konstantin Eduardovich Tsiolkovskiy).  
On the Occasion of the 100th Anniversary of his Birth  
(K 100-letiyu so dnya rozhdeniya)

PERIODICAL: Kryl'ya Rodiny, 1957, Nr 8, pp. 22-23 (USSR)

ABSTRACT: The article is a first installment of a popularly written biography of K. E. Tsiolkovskiy. The second and last installment will appear in the next issue of the Kryl'ya Rodiny. The author of the article lays stress on the scientific achievements of the eminent Russian scientist, apparently seeking to present him as the one who has paved the way for the recent successes in the field of applied sciences. Below are summarized the more important assertions made in the article: (a) The main scientific works of Tsiolkovskiy deal with three technological problems: the problem of directing the flight of rigid lighter-than-the-air airships with all-metal body; the problem of the form to be given to the heavier-than-the-air aircraft; and the problem of using jet propulsion

for interplanetary flights. It is that the bulk of Tsiolkovskiy's work related to the theory of flight of dirigibles was done between the years 1885 and 1892; that principal articles dealing with the building of heavier-than-the-air ships were published in 1894; and that Tsiolkovskiy began a systematic study of the theoretical aspects of the motion of the rockets as early as 1896. (b) The problem of flight of the lighter-than-the-air rigid airships is discussed in Tsiolkovskiy's work entitled "The Theory on Airships and its Practical Application" (Teoriya i Opyt Aerostata). Tsiolkovskiy is said to have been "the first to indicate what geometric form shall be given to the airship, and to calculate the required structural strength of the thin metallic sheath." The airship Tsiolkovskiy deals with is an air ship "of varying volume, and therefore independent, in regard to its lift power, of any possible changes in the temperatures of the surrounding air and in the altitudes of the flight". The exact date of the publication of this Tsiolkovskiy's work is not given. (c) with respect to the theory of flight of heavier-than-the-air airships, it is asserted that Tsiolkovskiy was the first to set forth the idea of an all-metal airplane. In an article published in 1894 under the title

TITLE: K.Ye. Tsiolkovskiy (Konstantin Eduardovich Tsiolkovskiy).  
On the occasion of the 100th anniversary of his birth  
(k 100-letiyu so dnya rozhdeniya)

PERIODICAL: Kryl'ya Rodiny 1957, Nr 9, pp. 14-16 (USSR)

ABSTRACT: The article is the 2nd and last installment of a popularly written biography of K.Ye. Tsiolkovskiy. The first installment appeared in Nr 8, 1957, of the Kryl'ya Rodiny. The author of the biography is chiefly concerned with the scientific achievements of the Russian scientist. In the part of the 2nd installment given to the outline of Tsiolkovskiy's achievements in the study of the influence of the force of gravity and of the drag on the flight of a rocket, Prof. Kosmodem'yanskiy indicates that Tsiolkovskiy's calculations concerning the optimum distribution in time of the thrust produced by a reactive engine in a vertical flight form the basis of a series of subsequent Soviet studies. In that connection he quotes his own, Kosmodem'yanskiy's, formula correlating the weight of the rocket and the force of resistance of the atmosphere:

Card 1/4

$$P = Q \left( 1 - \frac{v}{V_r} \right)$$

85-9-15/33

APPROVED FOR RELEASE: 06/14/2000 CIA-RDP86-00513R000825120016-6  
K.Ye. Tsiolkovskiy. On the occasion of his  
birth (Cont.)

where  $P$  - the weight of the rocket;  $Q$  - the force of resistance of the atmosphere;  $v$  - the velocity of the rocket; and  $V_r$  - the relative velocity of the ejected particles. The formula applies when the law governing the drag is quadratic. In describing K.Ye. Tsiolkovskiy's work in the field of rocket dynamics (both the purely scientific work and the work concerning the solution of practical technological problems), Prof. Kosmodem'yanskiy notes that Tsiolkovskiy's studies permitted to establish that the coefficient of efficiency of a reactive engine will approach 1 when the relative velocity of the ejected particles equals the velocity of the rocket itself, and indicates that the present relative velocity of the ejected particles is that of 1800 to 2500 m per second. With respect to Tsiolkovskiy's studies in the domain of fuel for rockets, the author of the article credits him with having formulated the basic requirements which these fuels must satisfy. Noteworthy among these 6 requirements - which are supposed to govern up to now the research - may be the 5th: the fuel "Must be liquid

Card 2/4

is said to  
locality of the last part, i.e. of the part carrying the useful load.  
Prof. Kosmodem'yanskiy indicates on that occasion that the construction of a rationally built "train of rockets" is now one of the  
actual problems of astrodynamics.

85-9-15/33

K.E. Tsiolkovskiy. On the occasion of the 100th anniversary of his birth (Cont.)

Kosmodem'yanskiy calls him the founder of that theory and lists the following ideas Tsiolkovskiy was assertedly the one to bring forth: the idea of using jet streams for steering the rockets; the idea of using gyroscopes for stabilizing the rockets traveling through gravity-less areas; and the idea of using the components of the fuel for cooling the exhaust nozzle. The author mentions also Tsiolkovskiy's idea of avoiding the burning out of the rockets returning to the Earth, by making them glide along inclined paths and by cooling them with a liquid oxidizer. Moreover, Tsiolkovskiy is said to have scientifically proven the theoretical possibility of traveling through space at cosmic speeds. The greatness of Tsiolkovskiy as scientist Prof. Kosmodem'yanskiy sees in that Tsiolkovskiy has correctly foreseen the lines of future developments in the field of science his contemporaries could not perceive. 2 photos

AUTHOR: Kosmodem'yanskiy, A.A., Professor 26-10-9/44

TITLE: An Eminent Pioneer of Science (Vydayushchiysya uchenyy-novator)

PERIODICAL: Priroda, October 1957, No 10, pp 73-78 (USSR)

ABSTRACT: The article deals with the life of K.E. Tsiolkovskiy, an eminent Russian scientist who was born on September 17, 1857. He was the initiator of the scientific theory on interplanetary travel and had made several outstanding discoveries in aerodynamics, rocket dynamics, geophysics and the theory of aviation. As early as 1929 he suggested the construction of multistage rockets or entire rocket trains on principles that are applied in modern artificial satellites. Tsiolkovskiy published a number of articles which dealt with 3 main problems: the construction of all-metal dirigibles, airplanes and rockets for interplanetary communication. He suggested various kinds of fuel for propelling rockets and figured out the quantities of fuel needed for the return trip to earth. Tsiolkovskiy earned recognition only after the Communist regime had taken over, when he was granted the means to publish the results of scientific research he had been conducting for years in miserable circumstances.

TITLE: Introduce the New, the Progressive in the Education in General-Scientific and General-Technical Disciplines (Novoye, progressivnoye - v prepodavaniye obshchenauuchnykh i obshchetekhnicheskikh distsiplin). Answer Questions Put Forward By Life (Otvetchat' na voprosy, vydvigayemye zhizn'yu)

PERIODICAL: Vestnik Vysshey Shkoly, 1958, # 4, pp 20 - 26 (USSR)

ABSTRACT: In the article, the author sets forth his views on the methods of instructing theoretical mechanics at higher technical schools with regard to the great achievements of our time in science and technics.

He enumerates these achievements, stating that the center of gravity of scientific searchings in theoretical mechanics has been shifted to the dynamical problems.

The new scientific subjects connected with rocket technique and nuclear power engineering call for a critical revision of scientific problems, even in such a classical subject as theoretical mechanics. The new demands, put forward by life itself, are not being reflected in lectures on theoretical mechanics, because of the small number of hours allotted to mechanics. In

Introduce the New, the Progressive in the Education in General-Scientific and General-Technical Disciplines

uses the following schedule of hours in the course in mechanics: second semester (16 weeks) 2 hours of lectures and 2 hours of practical exercises per week (for geometrical statics and the principle of possible permutations); third semester (16 weeks) 3 hours for lectures and 3 hours of practical exercises weekly (for the study of kinematics and the dynamics of the point); fourth semester (16 weeks) 3 hours weekly for lectures and 2 hours of practical exercises (for the study of the dynamics of system and solids as well as special chapters of dynamics). The author recommends that 128 hours of lectures and 112 of practical exercises, as in the above example, be allotted to the entire course. He divides the course into 4 sections: Statics, Kinematics, Dynamics of the Point, Dynamics of the System and Special Questions of Dynamics, giving the number of hours for each.

In conclusion, he affirms that a full course in theoretical mechanics is also required for electrical-engineers and radio operators.

K.E. Tsiolkovskiy --- yego zhizn' i raboty po raketnoy tekhnike (K.E. Tsiolkovskiy, His Life and Work in Rocket Engineering) Moscow, Voenizdat M-va obor. SSSR, 1960. 190 p. (Series: Nauchno-populyarnaya biblioteka) No. of copies printed not given.

Ed.: Ya.M. Kader; Tech. Ed.: Ye.K. Konovalova.

PURPOSE: This book is intended for the general reader.

COVERAGE: The book describes Tsiolkovskiy's scientific work in astronautics and in the theory of rocket propulsion. The first three Soviet artificial satellites are discussed. The TU-114 airliner is mentioned and shown in a photograph. The history of Soviet rocketry is sketched. The Soviet MR-1 meteorologic rocket used during the International Geophysical Year is described. No personalities are mentioned. There are no references.

optimal control, trajectory optimization, rocket thrust, lift drag ratio, aerody-  
namics, thrust control

ABSTRACT: The dynamics of horizontal flight of a rocket-powered aircraft in a grav-  
itational field are analyzed, with the effect of varying mass taken into account.  
An empirical method based on the calculus of variations is outlined for the solution  
of differential nonlinear equations of motion of the center of mass. Expressions  
are established for the time of flight and distance traveled during powered flight.  
The optimum law of variation of mass is established for which the powered flight  
time is maximum. The optimum thrust program is determined by an exponential function  
and depends only on lift-drag ratio of the aircraft. It was ascertained that the

TITLE: Determining the lift of an airfoil at an instantaneous change in angle of attack

SOURCE: Moscow. Universitet. Vestnik. Seriya I. Matematika, mehanika, no. 5, 1965, 52-60

TOPIC TAGS: <sup>14</sup> airfoil lift, trailing edge vortex, trailing vortex circulation, lift curve slope, angle of attack change

ABSTRACT: Formulas for the lift coefficient  $C_y$  of an airfoil and its increase  $dC_y/d\alpha$  caused by a sudden change in the angle of attack  $\alpha$  are derived by using the following model of lift generation in a plane-parallel flow: At the instant  $t = 0$ , when  $\alpha$  assumes instantaneously a new value  $\alpha_1 > \alpha$ , an initial Prandtl vortex leaves the sharp trailing edge of the airfoil. The circulation of this vortex increases with distance from the trailing edge, and at any instant  $t > 0$ , the circulation must have such a value that the Zhukovskiy hypothesis (about the finite velocities at the points where the airstream leaves the trailing edge) will be fulfilled. The axis of this trailing-edge vortex can be visualized as a small-radius cylinder on which the boundary layer leaving the airfoil surface is wrapped, thus gradually increasing the cir-

TITLE: Method for obtaining synthetic rubber. Class 39, No. 173942

SOURCE: Byulleten' isobreteniya i tovarnykh znakov, no. 16, 1965, 83

TOPIC TAGS: rubber, synthetic rubber, butadiene, styrene, polymer, copolymer,  
polymerization

ABSTRACT: This Author Certificate presents a method for obtaining synthetic rubber by polymerization or copolymerization of dienes with vinyl monomers, for example, butadiene with  $\alpha$ -methylstyrene, in aqueous emulsion at low temperatures in the presence of known free-radical-initiators and regulators employing emulsifiers. To improve the polymer properties, esters of monoalkylbenzoic acid are used as emulsifiers.

TITLE: Effect of the colloidal-chemical characteristics of soaps on the polymerization kinetics and properties of latex

SOURCE: Kolloidnyy zhurnal, v. 27, no. 6, 1965, 833-838

TOPIC TAGS: particle size, polymerization kinetics, soap, emulsion polymerization

ABSTRACT: The colloidal-chemical characteristics of potassium salts (soaps) of tert-butylbenzoic acid (DTBBA) and their relation to the kinetics of emulsion polymerization were studied by carrying out the emulsion copolymerization of bivinyl and  $\alpha$ -methylstyrene with these soaps and their mixtures. The soaps were found to have a low solubilizing capacity and a high value of the critical concentration of micelle formation (CCMF) as compared to soaps of disproportionated rosin and synthetic fatty acids. The rate of emulsion polymerization is determined primarily by the quantity and nature of the micellar soap present in the system. The quantity of the micellar soap in the mixture undergoing polymerization determines the character of the change

Card 1/2

UDC: 541.18:542.952/954

L 34418-66

ACC NR: AP6010546

in the surface tension of the latex and its magnitude. In latexes obtained from soaps with high CCMF the particle size is higher than in latexes of low CCMF. This is attributed to the fact that soaps of high CCMF have emulsifying properties in the presence of micelles, and after the latter disappear, the soaps have the properties of electrolytes, which promote the formation of larger latex particles. It is concluded that the CCMF value of soaps has a definite influence on the particle size of the latex particles, and that the fractional composition of the soaps influences the particle size distribution. Orig. art. has: 6 figures and 1 table.

TITLE: Sufficient conditions for an absolute extremum in one variational problem of the Boltz-Mayer type Z

SOURCE: Prikladnaya matematika i mehanika, v. 30, no. 3, 1966, 599-604

TOPIC TAGS: variational problem, rocket flight, rocket engine

ABSTRACT: Sufficient conditions for an absolute minimum in a variational problem of the Boltz-Mayer type are proposed. The source of the class of problems examined here is that certain functions depend parametrically in a well known way on time and the position of a discontinuity of the first kind. In the references it is shown that the problem posed here is a problem of variational calculus and with the aid of the classical understanding of variations, necessary conditions for extrema of a functional are derived. Application of the principle of optimality makes it possible to establish the existence of certain non trivial curves on which the absolute extremum of the given functional is reached. For example, the problem of a multiple stage rocket is considered. The formula obtained is a generalization of the Tsiolkovsky formula for the case of arbitrary motion of a continuous rocket. Related to the problem under 17

Card 1/2

L 43662-66

ACC NR: AP6022530

study is the well known problem of the dynamics of the flight against a programmed force of a jet engine assuming that the work of the engine takes place in the regime of maximum force and duration. In this case an absolute extremum of the functional is reached on a curve obtained through sliding regimes. Orig. art. has: 3 figures, 22 formulas.

Conditional reflex activity in white rats caused by administration of glucose during hypoxia. F. P. Kosmohinsky (Central Inst. Improvement Physiology, Moscow, V. V. Puzynin (5, 196, N 04-61156). White rats received 1 mg. insulin I (I) 100 g. body wt. 20-30 days developed rapidly motor-conditioned and defensive reflexes (fright, pain). I shortened latent period of the conditioned reflex and increased intensity. After developing of the conditioned reflexes the rats were brought in the balloon of Kolya-  
ski to the altitudes of 8, 16, and 11 X 10<sup>3</sup> m. for 1 h. 30 min. before the hypoxia the animals received subcutaneously I (1 mg.). Under these conditions only 1/3 of the animals was killed and only 2 showed the loss of the conditioned reflexes, while from the same no. of the control animals 3 were killed and 3 were deprived of the conditioned reflex activity. To increase the natural resistance of the animals against O<sub>2</sub> deficiency the control animals were injected 30 min. before the exp. with phenamine (I) 0.06 mg./100 g. body wt. and the exp. animals with 0.06 mg./100 g. body wt. and the exp. animals with I + II in the same doses. At 12000 m. altitude the animals injected with II died after 20-30 min. with I and II after 1-1/2 hrs. and with I alone after 1/2 hrs. Thus, I increases the organism's resistance against hypoxia.

KOSMOLINSKIY, Fr. P.

✓ Effect of thiamine on the processes of respiration during hypoxia. I. P. Krasnoshchek (Central Preventive Physician, Moscow). *Voprosy* No. 6, 73-5 (1950). Oxygen absorption ( $\dot{V}O_2$ ) of white rats was studied as regards thiamine (I) (1 mg./100 g. body wt) and thiamine (II) (1 mg./100 g. body wt) and the holding of the animals at simulated altitude of 3,000 m. for 3 hrs. The following  $\dot{V}O_2$  values were obtained (in  $\text{ml.} \text{ min.}^{-1} \text{ per mg. of dry kidney, liver, and brain} \text{ control}$ )—9.96, 5.3 (subcutaneous injection of I), but no change (40 mg. I injection)—10.4, 5.09, and 4.05; control animal to the high altitude (O deficiency)—11.53, 5.91 and the exptl. animals (with I) exposed to the O deficiency—11.12, 5.52, and 4.62 (in  $\text{ml.} \text{ min.}^{-1} \text{ per mg. of dry tissue}$ ). Activities of the tissue enzymes, succinate dehydrogenase (II), and cytochrome oxidase were greatly decreased by the altitude exposure. Administration of I increases activities; this decreases the altitude effect, particularly the activity of II in the tissue of the brain.

TITLE: Some characteristics of the effect of increased and decreased afferentation on the human organism from the standpoint of space psychophysiology

SOURCE: Voprosy psikhologii, no. 5, 1966, 67-71

TOPIC TAGS: human physiology, space physiology, space psychology, psychologic stress, isolation test, HUMAN SENSE, PSYCHOPHYSIOLOGY

ABSTRACT: Characteristics of human reactions to increased and decreased afferentation were studied using a variety of approaches. Formation of the "man-spacecraft-surrounding atmosphere" concept was studied in experiments with centrifuges and special testing units of the author's invention [not described]. In order to produce an excess of sensory information, various types of communication were imitated and interference close to the signal frequency being used was introduced. Results of these experiments were compared with data from sensory deprivation experiments and requirements for good nervous tolerance of changes in afferentation were formulated. Studies have shown that sensory deprivation produces important psychophysiological shifts, including lowered work capacity, loss of general tone, and appearance of apathy.

However, it is considered that the high degree of motivation associated with actual spaceflight will prevent the occurrence of pathological states such as depression, hallucination, and personality disintegration. The cosmonaut selection and training program is also mentioned as a factor in preventing severe psychic disturbances during prolonged isolation. Spaceflight situations presenting the cosmonaut with an excess of sensory information occur routinely during radiocommunication with Earth, during repair work or special scientific investigations, or in any complex spaceflight situation. In-flight aircraft refueling is considered a good model of a stress situation because it requires attention, accurate work, and a high degree of motor coordination. Furthermore, the refueling operation is usually performed when the pilot is in a state of poor physiological tone due to previous use of the automatic pilot. While refueling, pilots are under great emotional stress, and physiological limits are pushed (heart beat up to 160-186 beats/min, breathing rate up to 40-50 times/min, weight loss up to 5-7% of total). Psychophysiological analysis of these data reveals two main reasons for the acute strain. First, the pilot is upset by the narrowing of his field of vision to include the other aircraft. Secondly, psychological difficulty is created by the combination of two types of activity, the well-known habits of normal piloting and the unfamiliar tasks associated with refueling. Several preventive measures for avoiding nervous and emotional strain in conditions of sensory deprivation or excess information are suggested. First, the necessary postural and motor habits must be acquired, and the cosmonaut must learn to program situations correctly in advance. Stress can be avoided if the optimum work-rest regimes are observed and special patterns of motor activity are followed.

In order to increase general physiological supplementary tone and to reduce nervous tension, the following amounts of vitamins are recommended: 300 mg of ascorbic acid, 50-150 mg of vitamin P, 25 mg of vitamin B<sub>1</sub>, and others. [JS]

AUTHOR: Kosmodem'yanskiy, V. A.

TITLE: On the theory of multistage rockets

SOURCE: AN SSSR, Doklady\*, v. 156, no. 2, 1964, 286-289

TOPIC TAGS: rocket, rocket control theory, multistage rocket, flight dynamics, rocket flight

ABSTRACT: Let the motion(s) of a multi-stage rocket be determined by ordinary first order differential equations

$$g_s = \dot{x}_s - f_s(x_1, \dots, x_n, u_1, \dots, u_m, t) = 0 \quad (s = 1, \dots, n) \quad (1.1)$$

and a set of constraints

$$\psi_k = \psi_k(u_1, \dots, u_m, t) = 0 \quad (k = 1, \dots, r < m). \quad (1.2)$$

Card 1/3

ACCESSION NR: AP4036718

where  $x_s(t)$  are the coordinates of the dynamic system and  $u_i(t)$  is the control function having discontinuities of the first kind at times  $t_i$ , such that  $m-r$  of the  $u_j$  are given explicitly in terms of  $t$  and  $t_i$ . Let the state of the system at  $t = t_0$  be determined by the initial values

$$x_s(t_0) = x_s^0 \quad (s = 1, \dots, n) \quad u_j(t_0) = u_j^0 \quad (j = 1, \dots, m).$$

Then, at time  $T$ , the coordinates are related by certain equations

$$\Phi_i = \Phi_i[x_s(T), T] = 0 \quad (i = 1, \dots, p < n). \quad (1.3)$$

The problem is to find the (optimal) values of  $t_i$  (i.e., choosing the best rocket stages) corresponding to an extremal value of a functional  $J = J[x_s(T), T]$  subject to (1.1) and (1.2). For example,  $J$  may be the distance travelled, or the altitude, or the horizontal velocity at  $T$ . By the use of the auxiliary functional

$$I = J + \sum_{i=1}^p \rho_i \Phi_i + \int_0^T \left\{ \sum_{s=1}^n \lambda_s g_s + \sum_{k=1}^m \mu_k \psi_k \right\} dt, \quad (2.1)$$

Card: 2/3

ACCESSION NR: AP4036718

where  $\lambda_i(t)$ ,  $\mu_k(t)$ ,  $f_l$  are undetermined Lagrange multipliers, the problem is reduced to a variational problem of the Bolza-Mayer type. Assuming the rocket has three stages, the author derives equations for the variations of the coordinates at the points of discontinuity. Then, after choosing some of the multipliers in such a way that certain coefficients in  $\delta I$  are 0 and setting the remaining multipliers equal to 0, he is led to a system of differential and integro-differential equations which solve the problem. The theory is applied to the example of a two-stage rocket in a uniform gravitational field with no resistance of the medium. Here the function  $u(t)$  is the ratio of the variable mass of the rocket at time  $t$  to its initial mass.  $u$  drops suddenly at  $t_1$  (time at which the first stage is dropped), and is assumed to decrease linearly for other values of  $t$ . Orig. art. has: 1 figure and 21 formulas.

Title : Relationship between composition, temperature, and heat resistance. II.  
Ternary system Nickel-Chromium-Titanium alloys

Periodical : Izv. AN SSSR, Otd. Tekh. Nauk 2, 50-97, Feb 1955

Abstract : Studies the relationship between composition, structure, and heat resistance of Ni-Cr-Ti ternary system alloys over a wide temperature range (500-1200°). Twenty different alloys were tested. The chromium content was constant at 20% while titanium content was varied from 0% to 10%. Ritanium solubility was investigated at the following temperatures: 700°, 800°, 900°, 1000°, 1100°, and 1200°. Diagrams. Eight references, 7 USSR.

TITLE: Some data on the excretion of 17-hydroxycorticosteroids during a study of the efficiency of flight crews on long night flights

SOURCE: Konferentsiya po aviationskoy i kosmicheskoy meditsine, 1963. Aviationskaya i kosmicheskaya meditsina (Aviation and space medicine); materialy\* konferentsii. Moscow, 1963, 165-169

TOPIC TAGS: flight crew efficiency, flying time, homeostasis, neuroendocrine system, pituitary activity, adrenal activity, ACTH, corticosteroid production, hydroxycorticosteroid excretion, stress, hormone balance, night flying

ABSTRACT: During a study of the efficiency of nighttime flight crews, attention was directed towards the problem of homeostasis, in which the neuroendocrine system and particularly the pituitary-adrenal axis play an important role. In order to evaluate the effects of stress on ACTH and hence on glucocorticoid production, the authors determined the free and bound 17-hydroxycorticosteroids in urine samples taken immediately before take-off, after landing and during the first 6 hours after landing from crews participating in long-distance night flights. In general, the results showed a relatively low level of hormone

Card 1/2

ACCESSION NR: AT4042676

excretion during flight, and a significant increase after landing, a 50-150% increase being observed during the first 6 hours after landing in 12 out of 16 cases. In 2 crew members and 3 flight commanders, however, there was a significant increase (80-500%) in hormone excretion during flight. The authors noted a definite relationship between hormone excretion and the emotional state of the crew, and suggest that the increased excretion noted in some pilots and flight commanders is due to their increased responsibilities during prolonged complex operations.
